/itemdetails/:id	put	/api/items/:id	Edit item
/signup	post	/api/users/signup	Add user to db
/login	post	/api/users/login	Create a token for user

Narrative

We shared the glory of our cows with the class. Our cows are clearly superior to any other project. We successfully implemented the account system as well as connecting the front end to the server and then to the database. We also had difficulty with the file system and creating tokens for the user in authentications. It was challenging because it was our first time using everything. A possible direction is to add more information on the cows to the database as well as adding more cows.
